

Use dilutions up to 1:10 (1 ml of working solution and 10 ml of water; 100 ml of working solution and 1000 ml of water, etc.). Diluted Weston's will require longer development times -- possibly 10 minutes. Be sure your safety light does not fog the paper.

Another control in development is the amount of potassium bromide, that can be added to the developer. The optimum level can be found by the following procedure.

Mix the Stock Solution according to the instruction but omit the 10% potassium bromide solution. Add 5 ml of 10% potassium bromide per liter of working solution. Develop an unexposed strip of paper for 5 minutes with the safety light off. If the paper fogs, add another 5 ml portion of the potassium bromide solution and re-test the solution. When no fog appears, there is sufficient restrainer for the paper being used. Too much potassium bromide in the developer will decrease paper speed and increase the contrast.

PHOTOGRAPHERS' FORMULARY

FORMULARY EDWARD WESTON'S AMIDOL PAPER DEVELOPER

Directions for using Edward Weston's Amidol paper Developer: kit sizes, 1 liter (Catalog number 02-0010); 2 liter (Catalog number 02-0020); and 4 liter (Catalog number 02-0021).

Amidol, as a developer, produces rich, strong black tones which are slightly cool. Prints developed in amidol have very good tone separation. Formulary Weston's Amidol, which is almost identical to Edward Weston's original formula, produces rich prints with a strong impact. The working solution can be diluted to obtain softer results without greatly affecting the color. The formula contains citric acid which inhibits print stains by maintaining a low pH.

CHEMICAL SAFETY

All chemicals are dangerous and must be treated with respect. Please read the chemical warnings on each package.

Amidol is a poison and must be used with caution. It is probably absorbed through the skin. The use of tongs or disposable rubber gloves is recommended when working with amidol solutions.

Amidol stains: Staining is due to the air-oxidation of the free base of amidol that is present in neutral or alkaline solution. Soap, for example, is sufficiently alkaline to cause the amidol hydrochloride to be converted to the free base. In cleaning a darkroom after amidol use, first wash with water (amidol is very water-soluble) and then wash with a 2% solution of hydrochloric acid. The acid ensures that the amidol remains in the salt form. Once amidol has been oxidized and has stained, there is not much that can be done.

If an amidol solution should be spilled on the skin, wash the area first with water, then with a 2% solution of hydrochloric acid, and finally with soap and water.

The user assumes all risks upon accepting these chemicals. IF FOR ANY REASON YOU DO NOT WISH TO ASSUME ALL RISKS, PLEASE RETURN THE CHEMICALS FOR A FULL REFUND.
